

# DATA FOR EQUITY

## Purpose

Data for equity is achieved when equitable data practices permeate each phase of the data life cycle - from person-centered language and accessibility during the data collection phase, to specific analytic and visualization techniques during the reporting phase, to strategies applied during ongoing system improvement. This last phase, arguably the most impactful, requires an intentional framework that consists of assessing disparities in 1) access to services; 2) level of services provided; and 3) outcomes. Doing so prompts decisions and interventions that can help close disparity gaps and improve outcomes.

## Key Components

- Data for Equity Baseline Assessment
- Data for Equity Workshop Series
- Required
- Optional
- Accessibility Audit
- Dashboard Actionability Assessment
- Assessing Disparities Guide

## Moving Beyond the Equity Plateau

Social impact organizations are currently confronting the equity plateau: After identifying barriers to equity and creating processes to remedy inequitable practices, it's unclear how to produce long-lasting change. Data for equity provides a potent tool to move beyond the equity plateau - signaling what works, what doesn't, and what needs to be improved in order to make a difference.
